## WHAT IS CLAIMED IS:

1. A method of switching from execution of a first data processing task to execution of a second data processing task, comprising:

the first data processing task executing a call to a task switching function;
the task switching function selecting a return address corresponding to the second data processing task; and

the task switching function executing a return operation.

- 2. The method of Claim 1, wherein said selecting step includes the task switching function selecting a first pointer that points to a first area of memory where said return address is stored.
- 3. The method of Claim 2, wherein said pointer selecting step includes updating a second pointer to point to said first pointer.
- 4. The method of Claim 3, wherein said updating step includes updating the second pointer from a status wherein the second pointer points to a third pointer to a status wherein the second pointer points to said first pointer, and wherein said third pointer points to a second area of memory.

5. The method of Claim 4, wherein a return address corresponding to said first data processing task is stored in said second area of memory.

15

20

- 6. The method of Claim 5, including the task switching function storing said third pointer.
- 7. The method of Claim 1, including the task switching function deselecting a return address corresponding to the first data processing task.
  - 8. The method of Claim 1, including saving a return address corresponding to the first data processing task, and executing said saving step in parallel with said call executing step.
  - 9. The method of Claim 1, wherein said first data processing task is one of a host task, a disk task and a servo task of an optical drive control system, and wherein the second data processing task is another of said host task, said disk task and said servo task.
  - 10. The method of Claim 1, including, after said return executing step, the second data processing task executing a call to the task switching function, the task switching function selecting a return address corresponding to a third data processing task, and the task switching function executing a return operation.

11. An apparatus for switching from execution of a first task on a data processor to execution of a second task on the data processor, comprising:

10

a memory having a first storage location for storing a return address corresponding to the second task;

an input for receiving information indicative of instructions of a task switching function that has been called by the first task; and

a memory management apparatus coupled to said input and said memory, and responsive to said instruction information indicating a return instruction for moving said return address from said first storage location to a register of the data processor.

- 12. The apparatus of Claim 11, wherein said memory includes a second storage location for storing a first pointer which points to a first area of said memory that includes said first storage location, said memory management apparatus responsive to said instruction information for selecting said first pointer.
- 13. The apparatus of Claim 12, wherein said memory management apparatus
  15 includes a memory manager for maintaining a second pointer, said memory manager
  responsive to said instruction information for updating said second pointer to point to said
  first pointer in said memory.
- 14. The apparatus of Claim 13, wherein said memory manager is operable for updating said second pointer from a status wherein said second pointer points to a third pointer stored at a third location in said memory to a status wherein said second pointer

15

20

points to said first pointer, and wherein said third pointer points to a second area of said memory.

- 15. The apparatus of Claim 14, wherein said second area of said memory includes
  a fourth storage location which stores therein a return address corresponding to said first data
  processing task.
  - 16. The apparatus of Claim 15, wherein said memory manager is responsive to said instruction information for storing said third pointer in said third location of said memory.
    - 17. A data processing apparatus, comprising:

a data processing portion for executing first and second data processing tasks; a task switcher coupled to said data processing portion for switching from execution of the first task to execution of the second task, said task switcher including a memory having a storage location for storing a return address corresponding to the second task, and an input for receiving information indicative of instructions of a task switching function that has been called by the first task;

a register coupled to said task switcher; and

said task switcher including a memory management apparatus coupled to said input and said memory, and responsive to said instruction information indicating a return instruction for moving said return address from said storage location to said register.

- 18. The apparatus of Claim 17, wherein said task switcher includes a portion of a TriCore data processor architecture.
- 5 19. The apparatus of Claim 17, wherein said register is a program counter register.
  - 20. The apparatus of Claim 17, wherein said first data processing task is one of a host task, a disk task and a servo task of an optical drive control system, and wherein the second data processing task is another of said host task, said disk task and said servo task.
